1 Introduction

cvs is a command in Linux used to do version control.
cvs has the following command syntax:

```
cvs [cvs_options] cvs_command [command_options] [command_args]
```

2 [cvs_options]

3 cvs_command

The essential commands are:

- checkout
  This option creates a private copy of the source.

- update
  This option will update your source files with the changes other developers have made.

- add
  Adds new files in the cvs records of your working directory.

- remove
  Removes files from the repository.

- commit
  Publishes your changes to the source repository.
